Steps to follow for linking whatsapp and code

**Step-1:** Open the following website https://panel.rapiwha.com/landing/login.php
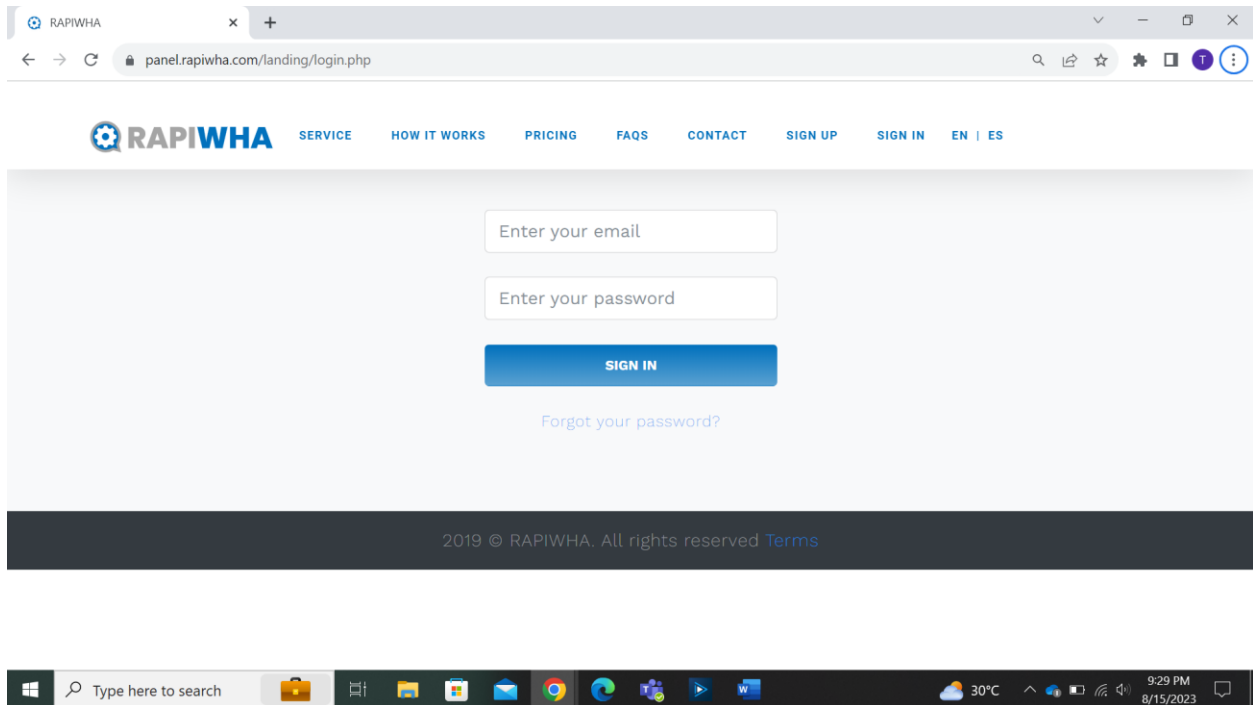

Step-2: Select Sign Up and enter your email id and set a password and login with same details..

Step-3: When this window appears,
scan the Qr with whatsapp by going to options>Linked Devices>Link a device. The link appears as if ur whatsapp is opened in MacOs don't worry its just a connetion to this API and your whatsapp.
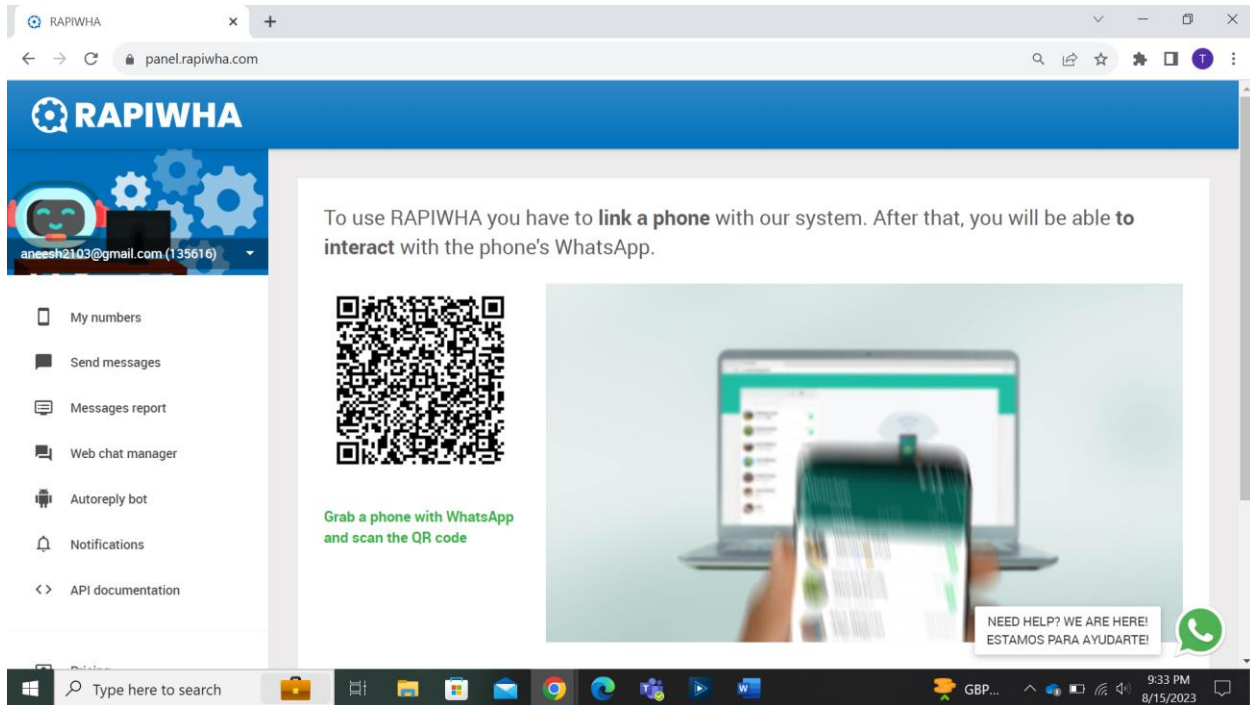

Step-4: Then this page appears keep the incoming messages to no orelse the incoming messgae might be viwed from this page...
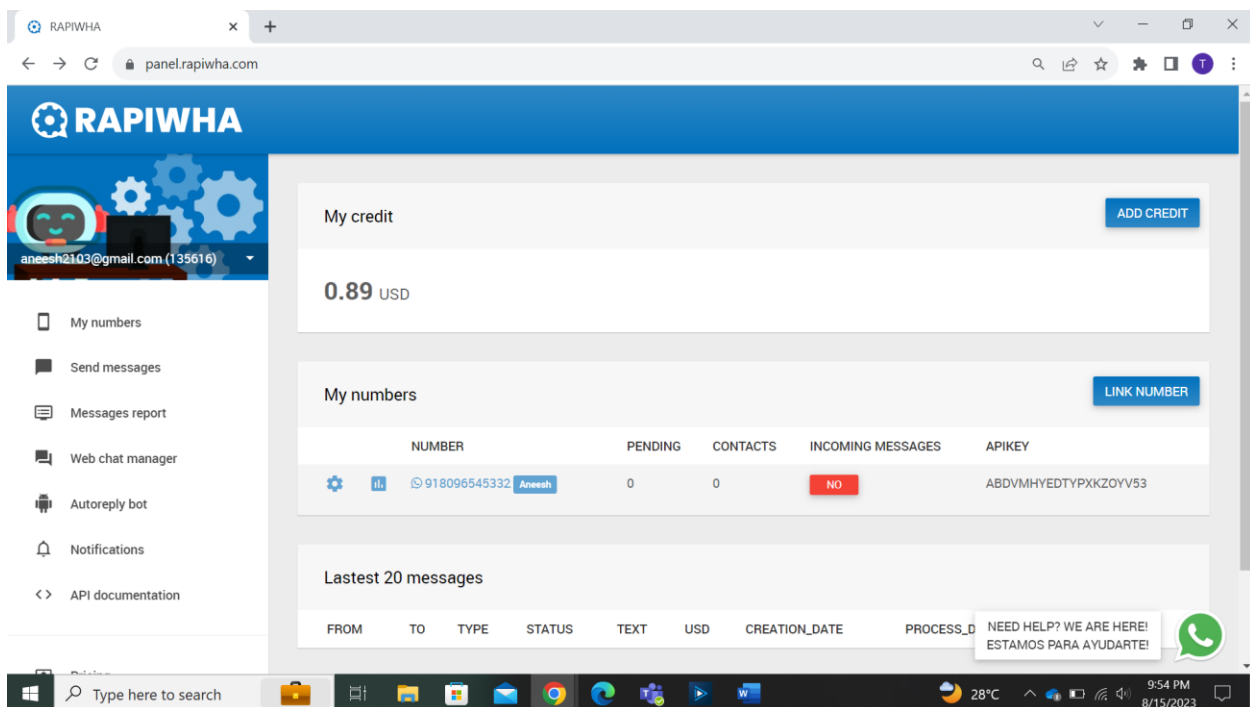

Step-5: Copy the APIKEY from your page and paste it in the code. In the code make changes like phone no. Message and remember that you can't send the message yourself. For other changes read the comments.

Note:

If the link is gone between your whatsapp and this API you can check it from the linked devices options. If the Mac device is not found in the linked devices then the link is gone.

You have to open the above website go to my numbers and click the settings options beside your number then this page appears. Go till the bottom of the page the remove number option appears select that as shown in the image.

Then repeat the process from step-3 as already mentioned above. Make sure you change the API key as it changes every time you unlink and link your device.

A message will be sent to yourself (you can check in the archive) don't worry its just a check between whatsapp and the RAPI. Following is the message

Health Monitoring
